

Anti-reverse grid-connected inverter

Overview

Anti-reverse-current grid-connected photovoltaic (PV) inverters are revolutionizing solar energy systems by preventing power backflow to solar panels during low-demand periods. Equipment required for function realization: photovoltaic grid-connected inverter, anti-backflow meter, communication line between meter and inverter Single-machine three-phase anti-backflow system solution For household low-power grid-connected inverters, the output current is small, generally. Within a PV system, the solar inverter plays a critical role in converting direct current (DC) into alternating current (AC). Depending on the application, different inverter types — grid-tie inverters, off-grid inverters, and microinverters — offer distinct advantages for various scenarios. This excess power is synchronized with grid power hence it can reverse the power flow. This technology ensures that the output power of the photovoltaic system does not exceed. In PV system, PV module output DC power through the inverter, converted to AC power for load use; when the power generation power of PV system is greater than the load power, due to the load can not consume all the PV power, the excess power will flow into the grid in the opposite direction. In the grid-connected two-way meter, the forward power is the power provided by the grid to the load, and the reverse power is the power delivered by the photovoltaic to the grid.

Anti-reverse grid-connected inverter

EK Anti-reverse current grid-connected inverter

sed for the developed grid tied solar inverter. The developed grid tied solar inverter uses a boost converter to regulate the DC power from solar PV panels and converts the output of the boost converter
