

Asmara clean electricity

Overview

This work is focused on the electrification of energy-intensive users in Asmara, the capital of Eritrea, in order to use the high solar radiation availability to supply electric loads which otherwise will require fossil fuels to be powered. Following these considerations, this work simulates the implementation of a micro-grid, using the software HOMER Pro, largely used for micro-grid simulation, in order to power an electrical system in a Sub-Saharan developing country, Eritrea, where the electrification rate is 76% in the urban areas. Eritrea has embarked on an ambitious renewable-energy programme aimed at tackling long-standing power shortages, promoting industrial growth, and ensuring sustainable development across the country. The initiative includes large-scale solar farms in the Southern and Northern Red Sea regions, wind. The African Development Fund grant will finance the construction of a 30-megawatt solar photovoltaic power plant with a battery backup system. This is expected to contribute to increasing generation capacity and grid energy to 185 MW and 365 gigawatt-hours/year, respectively. In our latest video, we explore the potential of electric buses to transform urban mobility—offering zero emissions, reduced noise, and. As a result of the new political stability achieved among Eritrea and Ethiopia, even though not completely consolidated after one year from the peace signed on 8 July 2018, the role of Asmara, the Eritrean capital, is under investigation to understand its potential impact on the economic and.
