

Base station power supply structure

Overview

Communications infrastructure equipment employs a variety of power system components. Power factor corrected (PFC) AC/DC power supplies with load sharing and redundancy (N+1) at the front-end feed dense, high efficiency DC/DC modules and point-of-load converters on the. A typical communication base station combines a cabinet and a pole. The cabinet houses critical components like main base station equipment, transmission equipment, power supply systems, and battery banks. Modern FPGAs and processors are built using advanced nanometer processes because they often perform calculations at fast speeds using low voltages (<0.9 V) at high current from compact. The 5G transmission is moving toward millimeter wave (mmWave) spectrum spanning up to 71 GHz to achieve the speeds that differentiates it from 4G. Power consumption rises as traffic does, however. It often needs multiple, precise voltages to operate correctly, with scarce leeway.

Base station power supply structure

Communications System Power Supply Designs

Unique solutions for DSL, VoIP and 3G Base Stations illustrate the wide range of power system architectures and the opportunities available for higher level integration.

- Voltage range: 691.2-947.2V
- >6000 cycles (100%DOD)
- Rated battery capacity: 216KWH (customizable)
- EMS communication: 4G/CAN/RS485

Selecting the Right Supplies for Powering 5G Base Stations

These tools simplify the task of selecting the right power management solutions for these devices and, thereby, provide an optimal power solution for 5G base stations components.
