

# Building distributed solar energy storage

## Overview

---

Energy storage is a crucial component of distributed generation, enabling better management of renewable resources. Distributed generation (DG) in the residential and commercial buildings sectors and in the industrial sector refers to onsite, behind-the-meter energy generation. DG often includes electricity from renewable energy systems such as solar photovoltaics (PV) and small wind turbines, as well as battery. These sources are often renewable, like solar panels, wind turbines, or geothermal systems, but can also include energy storage technologies. The data are compiled from a variety of sources, including utilities, state agencies, local permitting agencies, property assessors, and others. The. For solar-plus-storage—the pairing of solar photovoltaic (PV) and energy storage technologies—NLR researchers study and quantify the economic and grid impacts of distributed and utility-scale systems. Much of NLR's current energy storage research is informing solar-plus-storage analysis.
