

Communication base station solar panel thermal equipment

Overview

It integrates high-efficiency solar panels and durable lithium batteries to ensure continuous and stable operation of small telecom devices such as mini cellular towers, signal repeaters, surveillance cameras, weather stations, and rural WiFi transmitters. The communication base station installs solar panels outdoors, and adds MPPT solar controllers and other equipment in the computer room. The power generated by solar energy is used by the DC load of the base station computer room, and the insufficient power is supplemented by energy storage. Solar panels are often the primary energy source for remote telecom sites. They convert sunlight directly into electricity without moving parts, offering a reliable and low-maintenance power generation method. This section describes these components.
