

Communication base station wind power service level

Overview

The power requirements of communication base stations are relatively modest, so wind turbines with moderate power capacity are ideal. Additionally, the wind turbine must exhibit high stability and reliability to guarantee a safe and consistent power supply for. An individual base station with wind/photovoltaic (PV)/storage system exhibits limited scalability, resulting in poor economy and reliability. This paper establishes a capacity optimization. The presentation will give attention to the requirements on using windenergy as an energy source for powering mobile phone base stations. 5G base stations (BSs), which are the essential parts of the 5G network, are important user-side. The invention provides a communication base station, which comprises: the omnidirectional antenna is fixedly arranged on the wind driven generator and is electrically connected with an internal circuit of the wind driven generator; the wind driven generator provides a vertical mounting support for. Every off-grid base station has a diesel generator up to 4 kW to provide electricity for the electronic equipment involved.

Communication base station wind power service level

CN111836120A

The invention relates to the technical field of communication, in particular to a communication base station.

What are the requirements for wind

power in communication base stations

ICT can support the efficient scheduling of wind power generation and energy dispatch, and can be used in automation, protection, and even in reactive power control applications.
