

Design of small gravity energy storage system

Overview

Designed by University of Waterloo researchers, the solid gravity energy storage system is claimed to be suitable for storing renewable energy. It validates the feasibility of the system through the drive train setup. The drive train model involves storing potential energy by elevating the stack weight using solar photovoltaic input and hydro system; known as gravity energy storage. System as a new technology for small-scale use. Gravity-based energy storage systems utilize gravity's force to store. Gravity-based energy storage is a covenant technology that has the potential to play a critical role in addressing the challenges of integrating renewable energy sources into the electricity grid.
