

# Difference between 1-string and 2-string photovoltaic panels

## Overview

---

A string consists of solar panels wired in a series set into one input on a solar string inverter. Both options are possible wrt open-circuit voltage (Voc) and short-circuit current (Isc). I have 2 different angle panel strings because of my setup only 1 set can be angled at 35deg south facing and the other string only 12deg south facing. All panels are the same 1p5s 365w 40v VoC There is no option to place them both at 35deg due to space. I'm in the UK hence the 35Deg optimum, though. When setting up a solar photovoltaic (PV) system, understanding the concept of strings and their configurations is crucial. This blog will cover the essentials of solar PV strings, including how the number of panels on a string is calculated, the importance of startup and maximum DC voltage range. Photovoltaic (PV) systems are designed to efficiently convert solar energy into electricity. One of the most critical aspects of Proper string sizing ensures that PV modules operate within the allowable voltage and current limits of the inverter. This article provides an in-depth technical analysis of string sizing and MPPT, including. If the panel voltage allows and I had no shading, I would be running the 14 panel string (I have 3 x 14 panel strings on my roof and 1 x 10 panel string).

## Difference between 1-string and 2-string photovoltaic panels

---

### SmartSolar-MPPT 2 string or 1 string

There is a small price difference between 2x 250/60 and a RS100, the latter being slightly more cost effective. So, it could be worth experimenting with just 1x 250/60 and see how you get on.

### 1 string vs 2 string question

You have two MPPTs so one string per MPPT is optimal, they can be compared to see which is performing best and if a panel fails you only lose one string and know which string is faulty.

### One string or two?

In theory, the two strings should perform identically. If one string falls significantly below the other, that would indicate a problem on that string. The "Stringtool" calculator on the Aurora ...

### Why use Solar Panel Strings

MPPT with very high series voltage often have a notably lower PV input current limit. You essentially are forced to series as many as you can and are restricted to the number of strings you ...

### How to String Sizing

Connecting a solar panel in parallel connects multiple strings together. Electrically, this means that the voltage of each string remains the same, but the

current increases by the number of strings you have ...

## What's better, 1 big string or 2 smaller strings?

Two strings is only advantageous if shading is an issue. One string is more efficient. And higher amperage will create more heat than higher voltage.

---

## 1 string vs 2 strings

Two half sized strings in parallel is double the current, half the voltage. If the MPPT is limited to e.g. 16 A but the string each can generate 10 A, then the parallel stringed array current will ...
