

Discharge current of tool battery

Overview

For a battery with a capacity of 100 Amp-hrs, this equates to a discharge current of 100 Amps. A 1E rate is the discharge power to. When cordless power tool brands switched to Li-ion battery technologies, they spec'ed and advertised batteries according to two fundamental characteristics - voltage and charge capacity, with units of volts and amp-hours, respectively. Voltage is a widely-understood concept, and amp-hours less so. Does anyone know what the maximum discharge current of various m18 batteries is?

Specifically looking at using either an 8. In some anecdotal testing that others have done, it seems like certain tools will draw 80-100A peak, that should be enough for this starter, but it would be cool to. C- and E- rates - In describing batteries, discharge current is often expressed as a C-rate in order to normalize against battery capacity, which is often very different between batteries. A 1C rate. Stop using a battery as soon as you feel a substantial decrease in power from the tool.

Comparing Power Tool Battery Specs - Watt-Hours vs Amp-Hours

Most tool users should understand voltage (V) as being related to power, current (A) as a measure of electrical flow, and amp-hour (Ah) as a measure of charge capacity and how long a ...

What Do Ah and Capacity Mean on

Your Power Tool Battery?

Power tools typically discharge a battery at a 10C to 15C rate, depending on the power of the motor in the tool. So for a 4.0 Ah battery, this is a current of $4 \times 10 = 40$ amp for a 10C
