

# Earthquake-resistant cost-effectiveness of pv distribution

## Overview

---

This study demonstrates that integrating photovoltaic systems into super high-rise buildings can enhance their earthquake resilience by contributing to better stress distribution, reduced displacement, and increased energy absorption during seismic events. This report is available at no cost from the National Renewable Energy Laboratory (NREL) at [www.nrel.gov](http://www.nrel.gov). Elsworth, James and Otto Van Geet. Solar Photovoltaics in Severe Weather: Cost Considerations for Storm Hardening PV Systems for Resilience. Golden, CO: National Renewable Energy Laboratory. Earthquakes are among the most unpredictable and devastating natural disasters, capable of crippling infrastructure, disrupting power grids, and leaving communities in darkness for days or even weeks. As solar-plus-storage systems gain traction worldwide, questions arise about their vulnerability. Each year, the U. S. Department of Energy (DOE) Solar Energy Technologies Office (SETO) and its national laboratory partners analyze cost data for U. S. By analyzing the structural performance of buildings equipped with these sustainable energy systems under seismic loads, the study aims to identify potential benefits. It is expected that annually 630 gigawatts (GW) of solar photovoltaic (PV) energy will be produced by 2030 (IEA). Hence, any catastrophic failure loads may lead to an energy crisis. 2 billion, considering a wide variety of building types, including residential, commercial rooftop, and utility-scale ground-mount systems.

## Earthquake-resistant cost-effectiveness of pv distribution
