

# Equipment required for compressed air energy storage

CE UN38.3 

## Overview

---

It relies on well-proven components such as expanders, compressors, and gas turbines, which are widely used in various industrial applications, enhancing reliability and reducing risks associated with new technologies. Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distribution centers. In response to demand, the stored energy can be discharged by. CAES offers a powerful means to store excess electricity by using it to compress air, which can be released and expanded through a turbine to generate electricity when the grid requires additional power. The compressed air energy storage system described in this paper is suitable for storing large amounts of energy for extended periods of time.

### Compressed-air energy storage

Compressed-air energy storage can also be employed on a smaller scale, such as exploited by air cars and air-driven locomotives, and can use high-strength (e.g., carbon-fiber) air-storage tanks.

Air storage vessels vary in the thermodynamic conditions of the storage and on the technology used: 1. Constant volume storage (solution-mined caverns, above-ground vessels, aquifers, automotive applications, etc.)2. Constant pressure storage (underwater pressure vessels, hybrid pumped hydro / compressed air storage)
