

# Generator air intake height

## Overview

---

Per NFPA 37, maintain at least 10 feet of clearance from any building opening or air intake. Fan-assisted intake and discharge systems should be interlocked with the generator's controller. Safety features: Include emergency stop switches at the entrance and within line of sight of. The height of the wall and distance of the wall from the generator was systematically varied for this test case to determine the influence. One particular area CFD assists in is calculating the effect of louvers, exhaust air fans, and air discharge are required. The result is the required size of the air inlet opening in the. I'm building an enclosed generator shed and can't find answers to a few questions, the shed will be virtually airtight when completed (air intake and air exhaust aside) the engine exhaust gasses will exit through a separate double lined and insulated exhaust pipe, It's going to be tight getting. To avoid issues with your generator, guarantee proper clearances, like maintaining at least 36 inches on ends and 60 inches above for heat dissipation. Design ventilation systems considering heat and emission control, and keep exhaust outlets properly placed away from air intakes and occupied. Generator footprint: Start with the manufacturer's dimensional specs, which include length, width, and height. Minimum clearance requirements: NFPA 110 recommends a minimum of three feet at the front and sides of the.

## Generator air intake height

---

### Examples of Airflows for Different Enclosed Generator Applicatio

When discharging air vertically, because the generator is surrounded on all sides, can result in higher than ambient air temperatures being pushed into inlet vents.
