

Generator room air inlet and outlet shaft spacing

Overview

Industry studies show improper spacing can reduce cooling efficiency by up to 40%, turning your power plant into a very expensive space heater. Generator room air inlet and outlet shaft spacings and a louver free area of 50% is used. Total required intake/exhaust areas are presented for the number of active generators and transformers. The documents contain calculations for sizing ventilation systems for generator rooms, transformer. The temperature profile for the 50% wall height at 914 mm (36") spacing is shown in Figures 6 and 7.) Figure 7 shows the mid-line vertical slice. The exhaust plume is easily identified. Open packages are usually installed inside a building or beneath a canopied structure to protect them from the elements. Enclosed generators are generally specified for applications where the generator system is to be installed. Starlight Power recommends customers to adopt the sloping upper air intake method close to the control panel side of the unit, and add louvers and metal protective net curtains to prevent foreign objects from entering and ensure normal air convection.

Generator room air inlet and outlet shaft spacing

Generator Enclosure Spacing

First, create as much separation between intake air entry and discharge air exit planes in the building. If possible, have these two airflow streams on different sides of the building to prevent recirculation.
