

# High-voltage inverter control method

## Overview

---

This paper proposes a robust voltage control strategy for grid-forming (GFM) inverters in distribution networks to achieve power support and voltage optimization. Specifically, the GFM control approach primarily consists of a power synchronization loop, a voltage feedforward loop, and a current. Significant research has been conducted over the last four decades to build an effective control approach for removing unwanted harmonics. This article discusses several modulation approaches for multilevel inverters. These methods can be used for readers in research and engineering fields of renewable energy system.
