

# How big an inverter should I use for an 18kW power station

## Overview

---

A 4-6 kW inverter is ideal, depending on the load and surge requirements. Is it better to use one inverter or multiple inverters?

A. Choosing the right solar inverter size is critical—and one of the most common questions: what solar inverter size do I need?

Whether you are installing a rooftop system in California, powering a remote cabin in Alberta, or sizing for a community center in Rajasthan, getting it right means. Your inverter size should match your solar array's capacity, not your electricity bill. Your inverter needs to handle that. Watts (W) measure instant power while kilowatts (kW) are simply watts divided by 1,000. Example: Total load = 2,700 W (2.7 kW). Along with the solar panels' total power, factors like future expansion plans, partial shading, and temperature derating matter. A solar inverter should closely match your solar system's output in kW—typically within 80% to 120% of your total panel capacity. Whether you're planning a new solar installation or upgrading your existing setup, understanding inverter sizing can feel.
