

How many watts is a 6500k solar light

Overview

Higher lighting requirements of highways and parking lots start around 25 Watts / 2600 Lumens and go up to 70 Watts / 6500 Lumens. Note: The lower the wattage, the less the LED fixture has to work to produce the light. i. lower wattage can, at times, equal higher lumen per watt. But what does this 6500K actually mean?

The K stands for Kelvin which is the measurement unit for color temperature. These light colors range from yellow to white. The color of light produced by the white bulb appears blue-ish to imitate. 6500K daylight LED bulbs are not for everyone, especially in a residential application. Brightness varies by use case, 2. This temperature produces a very cool, bluish-white light, often described as “daylight” because it closely mimics the color of the bright midday sun. Lights in the 5000K to 6500K range are typically selected for task-oriented. This varies from fixture to fixture, manufacturer to manufacturer, and higher wattage does not always mean more light or higher lumen output.

How many watts is a 6500k solar light

Understanding Wattage Vs Lumens

They use more energy, producing light with only about 10-17 lumens per watt. LED bulbs stand out as the most energy-efficient option, providing 200 lumens per watt, which is the newest ...
