

# How to connect batteries in communication base stations in series

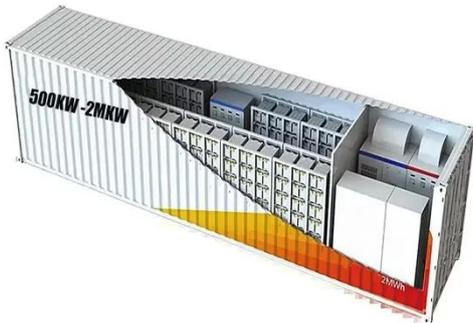

## Overview

---

To wire multiple batteries in series, connect the negative terminal (-) of one battery to the positive terminal (+) of another, and do the same to the rest. Take Renogy 12V 200Ah Core Series LiFePO4 Battery as an example. You can connect up to 4 such batteries in series. The illustrations below show how these set wiring variations can produce different voltage and amp hour outputs. In the graphics we've used sealed lead acid batteries but the concepts of how units are connected is true of all. Multiple interconnected batteries are called a battery bank. The first thing you need to know is that there are three primary ways to successfully connect batteries: The first is via a series connection, the second is called a parallel connection, and the third option is a combination of the two called a series-parallel connection.

 As discussed in this article, the closer the voltages and amp hour capacities of the various batteries wired together match, the less damage they will do to each other. Age also plays a part in these ratings and this is why it is usually recommended that you: 1. Only use batteries of the same voltage and amp hour capacity from the same manufacturer See more on batteryguy victronenergy
