

How wide is the zinc aluminum and magnesium photovoltaic bracket

Overview

Compared with steel photovoltaic brackets, zinc-aluminum-magnesium photovoltaic brackets are equally strong but lighter in weight, giving them more advantages in complex terrain conditions. Primary Composition: Primarily composed of aluminum alloy grades such as 6063 and 6005, belonging to the Al-Mg-Si alloy series. Density and Weight: Density approximately 2. It has better protection for the cutting edge of the steel plate, the welded part and the part of the coating damaged due to serious deformation. Zinc-aluminum-magnesium photovoltaic. The patented track has good component compatibility and convenient installation. 1. Its simple. Has extremely strong corrosion resistance: which is several to ten times higher than galvanized sheet within a certain range. With low friction coefficient and stable friction characteristics: it is very beneficial for stamping and can reduce the wear of the coating, thereby reducing the burrs. Photovoltaic solar brackets are mostly processed from black parts, and then sent to hot-dip galvanizing plants for galvanizing or directly bent and formed using hot-dip galvanized steel strips.

How wide is the zinc aluminum and magnesium photovoltaic bracke

Comparison of Aluminum Alloy and Zinc-Aluminum-Magnesium ...

Primary Composition: The base material is typically steel plate coated with a ternary alloy layer of zinc, aluminum, and magnesium. Although termed "zinc-aluminum-magnesium supports," ...
