

# Impact resistance of solar panel glass

## Overview

---

Bottom line up front: Recent tests prove 35mm hail impact resistance is achievable with tempered glass panels, but there's a critical design sweet spot. Oversized panels failed catastrophically while optimized designs passed rigorous TÜV SÜD testing. If solar energy is to be a reliable source of energy for people in hail-prone regions, the resistance of photovoltaic modules to hail damage must be improved. Credit: National Renewable Energy Laboratory

Hail is an expected hazard for farmers growing crops in the Great Plains region of the United. A new hail test for solar panels shoots small to large hailstones at solar panels while aimed to more accurately determine the panel's breaking point. Introduced by VDE Americas, the "Hail Resiliency Curve Test" simulates real-world hailstorm conditions where solar panels face numerous impacts from. Our Hail Durability Test (HDT) program subjects PV modules to higher kinetic energy (KE) values than basic product safety and qualification tests to investigate impact resistance at the threshold of damage, just over this threshold, and at material failure. It's a crucial aspect, especially considering the harsh environments these panels often face. This isn't just technical jargon; it's about keeping our renewable energy future economically viable.

### Single-glass versus double-glass: a deep dive into module reliability

Tempered glass, with its higher surface compressive stress of  $\geq 90\text{MPa}$ , offers a significantly stronger resistance to impacts compared to heat-strengthened glass, which has a surface
