

Innovation in Energy Storage System Safety

Overview

Innovation enhances energy storage safety through advanced materials, smart monitoring, fire suppression and robust regulations. However, fires at some BESS installations have caused concern in communities considering BESS as a. The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050. Today, ESS are found in a variety of industries and applications, including public utilities, energy companies and grid system providers, public and private transportation. ESS can also expose us to new hazards and safety risks. For example, Lithium Iron Phosphate (LFP) batteries have great safety characteristics and life, but Nickel Manganese Cobalt (NMC) batteries have. Advancements in energy storage systems (ESS) are important to attaining a sustainable and resilient energy future. These include low energy density.
