

Is it feasible to grow grass under photovoltaic panels

Overview

In more detail, sunlight exposure becomes limited because solar panels greatly shade the ground beneath, creating a microenvironment that is less conducive for grass growth. A study found that solar panels boost grassland productivity—with potential benefits for grazers, and for biodiversity—by up to 90%. Let the best of Anthropocene come to you. Situating solar panels on grasslands can boost grass growth by 20% on average—and as much as 90% in some areas—during dry. Grass struggles to thrive near solar photovoltaics due to four primary reasons: inadequate sunlight exposure, altered soil composition, disrupted water drainage, and pest presence. And while the grass under your trampoline grows by itself, researchers like me in the field of solar photovoltaic technology — made up of solar cells that convert sunlight directly. Solar panels are designed to capture sunlight and convert it into electricity. This means that they create shade underneath them, which can affect the growth of grass.

Is it feasible to grow grass under photovoltaic panels

Solar farms help grasslands beat the heat--

Situating solar panels on grasslands can boost grass growth by 20% on average--and as much as 90% in some areas--during dry periods.

Planning and Managing Permanent Vegetation Under Solar Arrays

To date, the most common plans for vegetation management under solar arrays are mechanical control (mowing), grazing sheep, and pollinator habitat, or a combination of these three.
