

Japan invests in solar power

Overview

The Japanese government has implemented policies and incentives to boost solar adoption, leading to a surge in solar installations across residential, commercial, and utility sectors. This growth is driven by technological innovations, decreasing costs, and a strong. Despite remaining heavily reliant on coal and gas, Japan is steadily advancing toward its 2050 decarbonization goal. Between 2014 and 2024, the share of solar power in electricity generation grew almost fivefold from 2% to nearly 10%, and the first half of 2025 marked the first time fossil fuels. Japan is a large installer of domestic PV systems, with most of them grid connected. [1] The country was a major manufacturer and exporter of photovoltaics (PV), with a global market share of around 50% in the early 2000s. This ambitious target represents a significant leap from the current capacity of approximately 87 GW (as of 2023, according to PVKnowhow's Japan Solar Panel Manufacturing Report). As the country aims to reduce reliance on fossil fuels and meet ambitious carbon neutrality goals by 2050, solar energy has become a cornerstone of its clean energy initiatives.

Solar power in Japan has been expanding since the late 1990s. Japan is a large installer of domestic PV systems, with most of them grid connected. The country was a major manufacturer and exporter of photovoltaics (PV), with a global market share of around 50% in the early 2000s. However, by 2019, this had dropped to below 1% due to the rise of state-backed production in China.
