

Lightning protection and grounding requirements for rooftop photovoltaic panels

Overview

Lightning protection systems (LPS) provide a protective zone to assure against direct strikes to PV systems by utilizing basic principles of air terminals, down conductors, equipotential bonding, separation distances and a low-impedance grounding electrode system. Some countries' building regulations require that public buildings (e. places of public assembly, schools and hospitals) be equipped with a lightning protection system. In case of industrial or private buildings it depends on their location, type of construction and utilisation whether a. Photovoltaic arrays are typically installed on rooftops, near power transmission lines, constructed of aluminum frames, and must be free from objects that shade them. Optimum exposure to sunlight also means increased vulnerability during electrical storms. Single air terminals offer a cone. The IEC 62305 standard series represents the most comprehensive international framework for lightning protection system (LPS) design, superseding numerous national standards and providing unified methodology for protecting structures and systems against lightning effects.
