

Measures to reduce wind power generation in summer

Overview

Options to reduce surplus energy are: output reduction of conventional power plants, export to other areas, demand side management, and energy storage. If these options are costly or have been exhausted, curtailment could be appropriate to manage the surplus energy of wind and solar. Curtailment is a reduction in the output of a generator from what it could otherwise produce given available resources, typically on an involuntary basis. Curtailment of generation has been a normal occurrence since the beginning of the electric power industry. Curtailing wind and solar is not necessarily a bad thing as it may enable larger shares of renewables through making them flexible.

Measures to reduce wind power generation in summer

Wind speed decline: Climate Change cuts wind power by 40%

Rising temperatures and their impact on atmospheric circulation are expected to reduce wind speed across Europe and North America. By mid-century, wind speeds could drop by 5%, with ...
