

Microgrid Hydropower Frequency Regulation

Overview

In this study, an optimal load frequency controller (LFC) for a hydropower-photovoltaic hybrid microgrid system was designed to improve the dynamic response when the load and photovoltaic output power are perturbed based on the off-policy integral reinforcement learning algorithm. HPPs operate in a standalone mode, but a continuously varying load generates voltage unbalances and frequency fluctuations which can cause. The integration of distributed generation (DG) is very popular with the microgrid, but the challenge is to control frequency when it is integrated with the hydropower plant. Since high penetration of renewable energy sources (RES) may rise to stability issues, frequency deviation or power mismatch.

Microgrid Hydropower Frequency Regulation

Frequency control by BESS for smooth Island transition of a hydro

One solution to assist the hydro generator for frequency regulation during island operation is to use a fast-acting device such as a BESS [10], which is interfaced to the grid by a voltage source inverter (VSI).
