

PV combiner box branch voltage is low

Overview

A 10%+ lower voltage indicates shading, module failure, or wiring faults. Higher voltage suggests open-circuit condition. Verify string configuration matches design—count modules per string. The voltage of each string before connecting to the combiner box is 108 volts in full sun 80% (great) but after connecting any of two strings together the voltage drops to 90 volts. Being new to solar thought I should ask if this is normal or do. As a critical electrical device on the DC side of photovoltaic systems, solar combiner boxes are susceptible to various types of faults, which are often interrelated. Here, we list the 10 most common problems, analyze their primary causes, and provide detailed diagnostic and resolution steps. In my case this connector had come slightly loose and was causing the low voltage. Perhaps it was the vibration from driving or something else. You can use a multimeter to measure these values.

PV combiner box branch voltage is low

Solar Combiner Boxes and Voltage Changes: What to Know

You should always pick a solar combiner box with a voltage rating higher than your system's highest voltage. This keeps your system safe and helps it last longer.
