

Photovoltaic panel glass transmittance standard

Overview

IEC 62805-2:2017 specifies methods for measuring the transmittance and reflectance of glass used in photovoltaic (PV) modules and provides instructions on how to calculate the effective hemispherical transmittance and reflectance of this glass. In building to different ways can be divided it can be made three categories. "Solar" in this context refers to the near ultraviolet, visible and near. This document specifies a test method of light transmittance for the laminated solar photovoltaic glass for use in building. The Electrical Conductivity Fulda M. Visible Light Transmittance (Tv, %) is the percentage of incident light in the wavelength range of 380 nm to 780 nm that is transmitted by the glass.

Transmittance and weight of solar panels with different thickness of glass

Transmittance: Around 91-93% of sunlight passes through--enough to keep efficiency high. Weight: Adds about 10-15kg to a standard 60-cell panel, manageable for rooftop installations.
