

# Photovoltaic panel powder purification process principle

## Overview

---

The core process involves a high-temperature pyrolysis furnace system that employs advanced pyrolysis technology to decompose the EVA encapsulation layer. This enables complete separation of materials like glass, silicon wafers, and copper without damage. Other recycling processes using etching techniques. Silicon wafers of the photovoltaic cell are separated using several types of chemical processes to recover pure silicon. Silicon wafers are initially removed from abandoned photovoltaic cells, which are done with the approval of The Paris Agreement in. This work proposes an integrated process flowsheet for the recovery of pure crystalline Si and Ag from end of life (EoL) Si photovoltaic (PV) panels consisting of a primary thermal treatment, followed by downstream hydrometallurgical processes. Aluminum, copper, tedlar, glass, ethyl vinyl acetate, silver, and silicon are all separated cleanly in the. Although various methods to recycle solar panels have been explored, they typically include three main stages: delamination, separation of materials (including metallic and non-metallic compounds), and extraction and purification [2, 14].
