

# Photovoltaic panels are highly polluting

## Overview

---

Once installed, solar panels produce electricity with virtually no air pollution or greenhouse gas emissions. Using solar energy can have a positive, indirect effect on the environment when solar energy replaces or reduces the use of other energy sources that have larger effects on the environment. For instance, the International Renewable Energy Agency (IRENA) estimates that by 2050, discarded solar panels could amount to 78 million tons of waste globally. When these panels get old, recycling them is expensive and difficult. Sites are likely to experience a higher-than-average risk of tornadoes, snow loads, and wind. Shading: A 50 percent drop in efficiency can occur with even 10 percent shading of an array.
