

Photovoltaic solar panel power generation angle calculation

Overview

The optimal tilt angle is calculated by adding 15 degrees to your latitude in winter and subtracting 15 degrees from your latitude in summer. Results are for informational planning only and do not account for all site-specific factors such as roof structure, local shading, structural load limits, building codes, electrical requirements. We started with flat panels and increased the angle of tilt to the south to see how much extra energy is gained through the year. Therefore we include a result. Optimize the tilt and placement of your solar panels with our free Sun Angle Calculator. Panels positioned perpendicular to the sun's rays absorb maximum energy, but the sun's position changes with seasons and your geographic location.
