

Solar glass prevents sweating

LPSB48V400H
48V or 51.2V

Overview

Since single-pane glass cools rapidly, creating a thermal barrier raises the surface temperature above the dew point. The most popular DIY method involves installing interior plastic shrink film kits. While it's difficult to entirely eliminate condensation, there are methods to. The more saturated the air is with moisture, the more/faster you get the sweats. They keep the air drier, and possibly significantly closer to the glass' temperature than your home. Sweating glass occurs when warm, humid air meets cooler glass, causing condensation.

Solar glass prevents sweating

Scientists Develop Transparent, Sun-Activated Coating That Prevents

A group of scientists at Switzerland's ETH Zurich has created a thin and transparent coating that, when applied to glass and other clear surfaces, operates as an anti-fog barrier.
