

Solar on-site energy recommendation Solar panels connected to the network cable

Overview

Yes, a solar PV system can be connected using supply side connections even if the panel lacks a main breaker. The utility connection for a PV solar system is governed by the National Electrical Code (NEC) Article. Connecting solar panels to the electrical grid is one of the most effective ways to maximize your solar investment while maintaining reliable power. The design is the same sort of point-to-point Ethernet technology based on single-mode fiber that's used in enterprises and industrial applications, as opposed to the Passive Optical Network (PON) approach used. Proper solar panel wire sizing is critical for system safety, efficiency, and compliance with electrical codes. Using undersized wire in your solar installation can result in dangerous overheating, significant energy losses from voltage drop, and costly equipment failures.
