

Solar thermal power generation major introduction

Overview

Solar thermal-electric power systems collect and concentrate sunlight to produce the high temperatures needed to generate electricity. The total amount of solar energy received on Earth is vastly more than the world's current and anticipated energy requirements. This steam is then used to turn turbines. Concentrating Solar Power (CSP) plants technology that is not yet widespread, and their relevance for the climate-neutral transformation of the global energy system is often under-estimated. This selective range of wavelength depends on the materials of the solar cells.
