

Sudden drop in photovoltaic panel power generation

Overview

Sudden big drop that stays low → possible inverter, wiring, or panel issue. Clean panels every 2-3 months (more often in dusty areas). Remove or reduce shading where possible. Ensure your inverter has good airflow and isn't shaded. Shade is one of the biggest efficiency killers. Trees grow, neighbors add floors, rooftop tanks get installed, or even a small shadow line shifts during different seasons. What to do: Look for shade between 10 AM and 3 PM. If normal degradation is 0.8% annually: Quality solar panels naturally lose efficiency over time, so a system producing 10,000 kWh in year one should generate around 9,950 kWh in year two - this gradual decline is expected and warranty-covered. Inverters are the weakest link in solar systems: Why the sudden drop in production?

So the last 3 days have been completely sunny in Florida, but my system when will sudden drops in production, then needing the batteries to kick in and not exporting to the grid. Before this, the system had been. Total solar newbie here so apologies in advance for the non technical language and/or dim questions! About 4 weeks ago we had 12 X 455 watts panels installed on our (flat) roof as two strings of 6 panels, with a Huawei Sun2000 6kTL inverter, grid tied to inject excess into the mains. However, in case your output suddenly drops in the middle of a sunny summer month, that is not good.
