

# The inverter pauses when increasing power

## Overview

---

Overvoltage happens when charging systems push the DC bus too high. Undervoltage signals insufficient battery or poor connection. Extend deceleration time on motor-driven loads. Unit faults can only be detected when high voltage power is restored. Note: Do not power on the inverter twice without identifying the cause of the failure, as. Inverter Display Issues Often Indicate Low DC Input Voltage or Reverse Polarity: If the inverter screen shows no display, it usually means the DC input voltage is below the minimum threshold or the PV strings are connected in reverse. Measuring the string voltage with a multimeter helps confirm the. Most “dead” inverters just lack power. Check: If you're using a TURSAN Off-Grid Inverter like the 3. When something goes wrong—like a power overload or wiring problem—the inverter turns off or “trips” to protect itself and your appliances. Think of it like a safety switch.
