

The role of candles in solar power generation

Overview

Now, in new work published in the journal Science, researchers report that a compound commonly used in candles can boost the energy-storing capacity and the lifespan of flow batteries compared to today's devices. Cost and materials are two important factors to consider for grid-scale. A beautiful method based on solar energy to heat and melt the paraffin or bees wax has been developed to manufacture the candles by a linear Fresnel reflecting solar concentrating collector and a bucket. The solar method has several advantages over the conventional candle making methods. These candles are powered by sunlight, eliminating the need for batteries or electricity and contributing to a greener environment.
