

# There are several modes of photovoltaic panels

## Overview

---

The six main types of solar panels are polycrystalline, monocrystalline, thin-film, transparent, solar tiles, and perovskite. All of these are photovoltaic panels - meaning they use daylight to generate electricity - and they're all categorised based on their material. What kind of home do you live in?

When you're considering whether to get solar panels, it's a good idea to look into all the different types, to ensure you choose the best. There are several types of solar panels available on the market today, each with its own unique set of characteristics and advantages. Whether you're a homeowner looking to reduce your energy bills, or a business owner seeking to embrace sustainable energy solutions, understanding the different. However, different PV system modes are suitable for different application scenarios. Choosing a PV system that suits your needs can not only improve energy efficiency, but also save electricity costs. Depending on the type, it may also include batteries and a charge controller, working together to convert and utilize energy from sunlight. In this blog, we will delve into the different types of solar energy technologies.
