

# Victoria Fire Station uses a 60kW photovoltaic energy storage unit

## Overview

---

This guideline adopts the umbrella term 'BESS unit' to succinctly capture the variety of BESS cabinets, containers and enclosures in which BESS modules are housed. The type of BESS unit must be specified in Part 1. It encompasses provisions for designers and facility operators where lithium-ion (Li-ion) BESS technologies are used or proposed to be used, which inherently maintain the potential to initiate a thermal runaway event or fire. These systems do not pose health, safety, or environmental risks under normal operating. Following review of a Risk Management Plan, CFA may request the preparation of a fire safety study for large-scale battery energy storage systems (BESS) over 1MWh where the design, capacity, complexity, location or proposed operations necessitate an enhanced, detailed analysis of requirements for. Basic firefighter strategies and tactics needed to mitigate a residential structure fire have changed with the installation of thousands of solar panel and battery energy storage systems (ESS) in homes across the United States. As such, firefighters need updated training that addresses the presence. Approximately 95,000 terawatts (TW) of energy from the sun are accessible for clean power generation. Global energy demand is currently estimated at 18 TW, which is a small fraction of what is available.
