

# What are the lamination processes of photovoltaic panels

## Overview

---

The lamination process involves pumping the air out of the module layers in a vacuum chamber, heating the layers to melt the encapsulant, and pressing the layers together with a flexible diaphragm to embed the cells in encapsulant and adhere the front and back sheets. Solar panel lamination is crucial to ensure the longevity of the solar cells of a module. This protective layer, typically made of ethylene-vinyl acetate (EVA) or polyvinyl butyral (PVB). This text provides an overview of the PhotoVoltaic lamination process. It also provides an example of a typical cycle time for EVA/POE lamination.
