Overview

The rated power of the flywheel is 100 kW. Delivered energy corresponds to a 15-second discharge at rated power ($1.5 \text{ MJ} = 100 \text{ kW} \cdot 15 \text{ s}$). A duty factor of 100% is defined as 100 kW, 15-second discharge from full speed, 100 kW, 15-second. Flywheel energy storage (FES) works by spinning a rotor (flywheel) and maintaining the energy in the system as rotational energy. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy to the system. In their modern form, flywheel energy storage systems are standalone machines that absorb or provide electricity to an application. When excess electricity is available, it is used to accelerate a flywheel to a very high speed. The flywheel is connected to an electrical machine that acts as a motor during charging and a generator during discharging. Kinetic energy can be described as "energy of motion," in this case the motion of a spinning mass, called a rotor. The rotor spins in a nearly frictionless enclosure.

What does kw mean in flywheel energy storage system

DOE ESHB Chapter 7 Flywheels

Flywheel systems in service today demonstrate millisecond response times, energy storage up to 700 kWh per rotor, power output of up to 500 MW per rotor, and decades of service life.
