## Overview

---

In contrast to rated power, the peak, surge, or instantaneous power gives the maximum power that an inverter can output over a short period of time. More often than not, this is stated as double the rated power. This “ peak power ” typically lasts a few seconds only and is quite important because it decides the stability of the inverter, battery, or solar. What is the difference between rated power and peak power of inverter?

Rated power and peak power are different due to their meaning. This represents the inverter's normal operating capacity.
