

# What is the ingot for solar power generation

## Overview

---

A silicon ingot is the bulk form of crystalline silicon before it is thinly sliced into wafers. A high speed wire saw with diamond blades slices the ingot into round wafers about 300 to 1000 microns in thickness, and 25 mm to 300 mm in diameter. These wafers are used in solar cells. Ingot manufacturing comes in between the transformation of silicon to solar-grade finished solar cells. The process of melting polysilicon into ingots and subsequently cutting them into wafers is wedged between polysilicon production and cell manufacturing. Wafers are then processed to form the PV cells.
