

Where is the wind of the European leaf generator turned on

Overview

Driven in rotation by the blade, without belts or gears, the magnets pass in front of the coils and thus generate an alternating current. This is immediately rectified in direct current to be able to sum the currents. Luckily, a French entrepreneur may have the solution - a small-scale wind turbine that look just like a tree! What are Wind Trees?

Known as the "Wind Tree" (or Tree Vent, in French), this wind turbine could lead to wider adoption of wind power in urban centers, where they would be able to make use. Produce your green electricity with the Aeroleaf®, the first micro-turbine that reinvents wind power. Our team has developed strong. Energy company New World Wind develops Aeroleaf Hybrid technology, a micro-wind turbine in the shape of a tree whose leaves capture the air as they rotate. As the. The electricity generator has synthetic leaves with small strips of specialized plastic inside. "As it is biomorphic, people cannot see at the first look that it is a renewable system," says Luc Eric Krief, owner of New World Wind, the French company behind the 'Aeroleaf' technology.

Where is the wind of the European leaf generator turned on

Efficient Electricity Generator Inspired by Leaf Movement

The electricity generator has synthetic leaves with small strips of specialized plastic inside. When the leaves sway in the wind, the small strips release an electrical charge.
