

Wind power generation planning for communication base stations in Bolivia

Overview

Our study introduces a communications and power coordination planning (CPCP) model that encompasses both distributed energy resources and base stations to improve communication . This book looks at the challenge of providing reliable and cost-effective power solutions to expanding communications networks in remote and rural areas where grid electricity is limited or not available. The geospatial plans are not government-endorsed roadmaps. They are intended as reference material to support future electricity access. Within the overall program, the project "Improving Access to Renewable Energy in Rural Communities in Bolivia" aims to improve the quality of life of rural population by having access to energy in remote areas through renewable energy. An individual base station with wind/photovoltaic (PV)/storage system exhibits limited scalability, resulting in poor economy and reliability. Expansion of the electric grid is closely connected with the goal to eradicate extreme poverty in the country, especially of the people. 5G base stations (BSs), which are the essential parts of the 5G network, are important user-side flexible resources in demand response (DR) for electric power system. The optimization of PV and ESS setup according to local conditions has a.
