

Wind turbine blades hoisted by aircraft

Overview

Called WindRunner, and expected by 2030, it'll haul just one thing: massive wind-turbine blades. This size constraint comes not from the limits of blade engineering or physics; it's. Range (Max. Payload) *Aircraft displayed with cargo doors closed (top) and cargo doors open (bottom) . Aeronautical engineering at a preposterous scale: At 108 meters in length, WindRunner will look like an oil tanker that's sprouted wings. The world's largest airplane, when it's built, will stretch more than a football field from tip to tail. Sixty percent longer than the biggest existing aircraft. Radia's WindRunner, a gigantic aircraft with a 356-foot wingspan, aims to airlift massive wind turbine blades up to 300 feet long, bypassing road and rail transport limits for onshore farms. The World Economic Forum's Global Future Council on the Future of Energy Transition champions the transition to renewable energy.

Wind turbine blades hoisted by aircraft

The Sky's the Limit: Building the Plane to Carry Giant Wind Turbine Blades

Radia, a Boulder-based aerospace startup, is building the WindRunner, an aircraft longer than a football field, designed solely to haul massive wind-turbine blades to remote sites, says IEEE
